

Credit Card Customer Report – Project Report

❖ Project Title

Credit Card Customer Report Dashboard

❖ Project Overview

The **Credit Card Customer Report Dashboard** is an interactive Power BI dashboard developed to analyze credit card customer data, revenue, transaction amounts, customer income, and demographic characteristics.

The dashboard provides a consolidated view of customer performance through **KPI cards, charts, tables, and interactive filters**.

It helps users understand customer behavior and identify patterns based on gender, age group, salary group, job, state, education, marital status, and dependent count.

❖ Project Objectives

The main objectives of this project are:

- To analyze total customer revenue.
 - To analyze total interest generated.
 - To understand customer income.
 - To analyze revenue trends over time.
 - To compare revenue between male and female customers.
 - To identify the top states by revenue.
 - To analyze customer job categories.
 - To analyze customers according to salary groups.
 - To understand customer distribution by age group.
 - To analyze marital status and education level.
 - To provide an interactive dashboard for business analysis.
-

❖ Tools and Technologies

Microsoft Power BI

Used to create the interactive dashboard and visualizations.

Power Query

Used for data cleaning, transformation, and preparation.

DAX

Used for creating calculated measures and KPIs.

Excel / CSV

Used as the data source and for preliminary data preparation.

❖ Data Analysis Workflow

The project follows the below workflow:

Raw Customer Data

↓

Data Cleaning

↓

Data Transformation

↓

Data Modeling

↓

DAX Measures

↓

KPI Creation

↓

Data Visualization

Interactive Power BI Dashboard

↓

Business Insights

❖ Dashboard KPIs

The dashboard contains four major KPI cards.

Total Revenue

55.32M

Represents the total revenue generated from customers in the displayed dashboard view.

Total Interest

7.84M

Represents the total interest amount.

Total Income

576M

Represents the combined customer income.

Average CSS

3.19

Represents the average CSS value displayed in the report.

KPI values can change when filters are applied.

❖ **Dashboard Visualizations**

▪ **Revenue Trend by Gender**

A line chart is used to analyze revenue trends over time.

The chart compares:

- Female customers
- Male customers

Purpose

This visualization helps to:

- Analyze monthly revenue.
- Compare male and female revenue.
- Identify revenue increases and decreases.
- Identify periods with higher revenue.

▪ **Age Group Analysis**

The Age Group chart analyzes customer contribution across different age groups.

Age groups include:

- 20–30
- 30–40

- 40–50
- 50–60
- 60+

The chart is further divided by gender.

Purpose

It helps understand which age groups contribute more to the business.

▪ **Gender Analysis**

The dashboard provides a comparison between male and female customers.

In the displayed dashboard:

- **Male:** 30.22M
- **Female:** 25.09M

This visualization provides a quick understanding of the contribution of each gender.

▪ **Customer Job Analysis**

The Customer Job Analysis table provides information about different customer job categories.

Categories include:

- Blue-collar
- Businessman
- Govt
- Retirees
- Self-employed
- White-collar

The table includes:

- Total Revenue
- Total Transaction Amount
- Total Income

Purpose

This helps analyze the financial contribution of customers from different professional categories.

▪ **Top 5 States by Revenue**

The dashboard includes a bar chart showing the top five states based on revenue.

The displayed states are:

1. TX – Texas
2. NY – New York
3. CA – California
4. FL – Florida
5. NJ – New Jersey

Purpose

This analysis helps identify important geographical revenue contributors.

▪ **Salary Group Analysis**

Customers are divided into three salary groups:

- **Low**
- **Mid**
- **High**

The chart also compares male and female customers.

Purpose

The analysis helps understand how customer salary groups contribute to overall business performance.

▪ **Dependent Count Analysis**

The dashboard analyzes customers based on the number of dependents.

The visualization compares different dependent-count groups by gender.

Purpose

It helps understand whether customer contribution varies according to the number of dependents.

▪ **Marital Status Analysis**

The dashboard analyzes customers according to marital status.

Categories include:

- Married
- Single
- Unknown

The visualization also provides a gender-wise comparison.

Purpose

This helps identify differences in customer contribution across marital-status groups.

12. Education Level Analysis

The dashboard contains an Education Level analysis.

Categories include:

- Graduate
- High School
- Unknown
- Uneducated
- Post-Graduate
- Doctorate

The chart compares these groups by gender.

Purpose

It helps understand customer characteristics based on educational background.

❖ **Interactive Filters**

The dashboard provides four main filters.

Quarter

Used to analyze customer performance for a selected quarter.

Week Start Date

Used to filter the report based on a particular date or week.

Gender

Used to analyze selected gender categories.

Card Category

Used to compare customer performance across different card categories.

These filters make the dashboard interactive and allow users to perform customized analysis.

❖ Key Observations

Based on the supplied dashboard screenshot:

- Total Revenue is **55.32M**.
- Total Interest is **7.84M**.
- Total Income is **576M**.
- Average CSS is **3.19**.
- The displayed gender analysis shows **30.22M for Male** and **25.09M for Female**.
- TX, NY, CA, FL, and NJ are displayed in the Top 5 States by Revenue chart.
- Revenue changes across different months in the Revenue Trend chart.
- Customer behavior is analyzed using multiple demographic and professional dimensions.

❖ Conclusion

The **Credit Card Customer Report Dashboard** demonstrates the practical application of Power BI for business and customer analytics.

The dashboard combines **KPI analysis, revenue trends, customer demographics, job analysis, state-level analysis, salary groups, education, marital status, and dependent count** into a single interactive report.

The project provides a structured approach to understanding customer behavior and business performance while demonstrating practical skills in **Power BI, Power Query, DAX, data visualization, and business intelligence**.
